Healthcare Product Management

Module 3: Designing for Users, Stakeholders, and Power

In healthcare, a great user experience is necessary but insufficient; success is dictated by the alignment of power and incentives.

Course Outline

Users vs. Stakeholders: The Great Divide

Distinguishing between those who touch the product and those who control its fate is critical for PM survival.

- Primary Users: The clinicians, patients, or staff whose daily workflow is directly impacted.
- Secondary Stakeholders: IT security, billing departments, and legal teams who set the constraints.
- The Economic Buyer: The administrator or executive who prioritizes the budget.

Artifact Prep: List your primary users and identify at least three secondary stakeholders who could block adoption.

Adoption as a Political Problem

Every new product redistributes work, data, or influence—and those losing power will resist.

"Workflow is Power": Changing how a nurse works is a political act, not just a technical update.

The "Not Invented Here" Syndrome: Resistance from internal IT or clinical teams who feel bypassed.

Identifying the "Incentive Gap": When a tool helps the patient but creates more work for the clinician.

Designing for "Neutrality": How to minimize the perceived threat to existing power structures.

Mapping Trust and Power Dynamics

Trust is the "currency" of healthcare; without it, even the most evidence-based product will fail.

Clinical & Institutional Trust

- Clinical Trust: Does the tool respect clinical expertise or try to replace it?
- Institutional Trust: Does the vendor understand the hospital's unique culture and constraints?

Power Mapping

- Identifying the "Clinical Champions" vs. the "Silent Saboteurs."

Artifact Prep: Trust Risk Identification

Identify one "Trust Risk" in your concept—where might a user or stakeholder feel their authority is undermined or their workflow is threatened?

The "Gatekeeper" Reality

Healthcare is a series of gates; you must design features specifically to satisfy the gatekeepers.

The IT Gate

Security, interoperability, and "single sign-on" are core features, not technical afterthoughts.

The Legal Gate

HIPAA, GDPR, and liability protection are non-negotiable constraints for any deployment.

The Financial Gate

Proving ROI (Return on Investment) or VOI (Value on Investment) to secure budget priority.

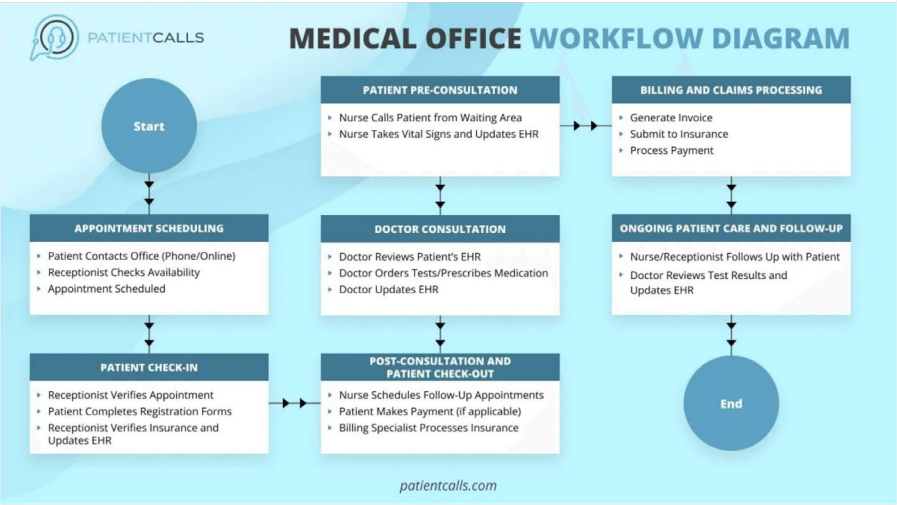
PM Strategy

Treat "Compliance" and "Security" as core user personas with their own set of requirements. A tool that fails a security audit is a dead product, regardless of clinical utility.

Designing for "Shadow Stakeholders"

Secondary stakeholders often have "veto power" without ever appearing in a user journey map.

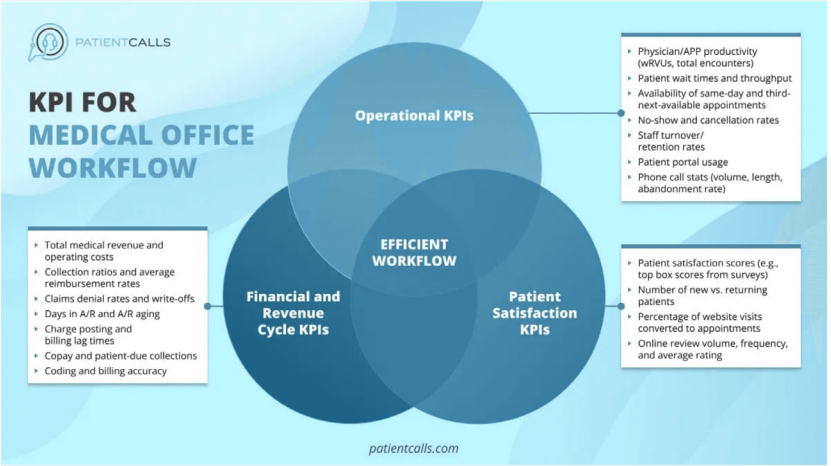
- Medical Records/HIM: Will this tool make their auditing harder?
- Pharmacy: Does this bypass their established safety protocols?
- Patient Families: Do they understand the tech being used on their loved ones?
- The "Invisible User": Designing for the person who has to maintain or audit the system.



Incentive Alignment: The "Who Wins?" Test

A product only scales if it creates a "Win-Win-Win" across the user, the buyer, and the patient.

- The User Win: Does it save time or reduce cognitive load?
- The Buyer Win: Does it save money, increase revenue, or reduce risk?
- The Patient Win: Does it improve outcomes or experience?
- The "Misalignment Trap": When the patient wins but the doctor loses time and the hospital loses money.



Artifact Checkpoint: What You Should Have So Far

Your artifact should now reflect the complex human and political environment of your problem.

- ☑ **Primary Users**
  Specific personas (e.g., "Triage Nurses in high-volume ERs").
- ☑ **Secondary Stakeholders**
  The gatekeepers (e.g., "Hospital IT Security," "CMIO").
- ☑ **Adoption Blockers**
  Specific political or workflow hurdles (e.g., "Resistance to manual data entry").
- ☑ **Trust & Incentive Risks**
  Where the "Win-Win" breaks down (e.g., "Increased documentation time").

Summary: Designing for the Ecosystem

Successful healthcare PMs design for the entire ecosystem, not just the interface.

Power Dynamics

Power dynamics are as real as software bugs; understanding who can say "No" is as critical as understanding who says "Yes."

Incentive Alignment

Incentives drive adoption more than features do; ensure your product creates a "Win-Win-Win" for users, buyers, and patients.

Trust Building

Trust is earned by respecting existing workflows and expertise, and by treating compliance and security as core product values.
